NaCl

From an experiment, it was found that there are 4 Na^+ ions and 4 Cl^- ions in a cube of sodium chloride crystal of volume $1.80 \times 10^{-22} \text{ cm}^3$.

- (i) Express the total mass of 4 Na^+ ions and 4 Cl^- ions in terms of the Avogadro's constant L .
(Relative atomic masses: $\text{Na}=23.0$, $\text{Cl}=35.5$)
- (ii) Hence, calculate the Avogadro's constant L , given that 1.00 cm^3 of sodium chloride crystal weighs 2.17 g .

Solution

- (i) Express the total mass of 4Na^+ ions and 4Cl^- ions in terms of the Avogadro's constant L .
(Relative atomic masses: $\text{Na}=23.0$, $\text{Cl}=35.5$)

$$4\text{Na}^+ \text{ ions} = (4 \times 23.0) / L = 92/L$$

$$4\text{Cl}^- \text{ ions} = (4 \times 35.5) / L = 142/L$$

- (ii) Hence, calculate the Avogadro's constant L , given that 1.00 cm^3 of sodium chloride crystal weighs 2.17g .

$$\begin{aligned} \text{Density of NaCl} &= 2.17\text{g} / 1\text{cm}^3 \\ &= (92/L + 142/L) / 1.80 \times 10^{-22} \text{cm}^3 \\ L &= 5.99 \times 10^{23} \text{mol}^{-1} \end{aligned}$$
